# Stock Name: Beaked redfish in ICES subareas 1 and 2 (Northeast Arctic)

## Advice on fishing opportunities

The ad hoc Joint Russian-Norwegian working group on Arctic Fisheries (JRN-AFWG) advises that when the status quo approach is applied, catches in 2023 should be no more than 66 779 tonnes, and catches in 2024 should be no more than 70 164 tonnes.

## Stock development over time

Fishing pressure on the stock is above  $F_{MSY19+}$  and spawning-stock size is above  $B_{pa}$  and  $B_{lim}$ .

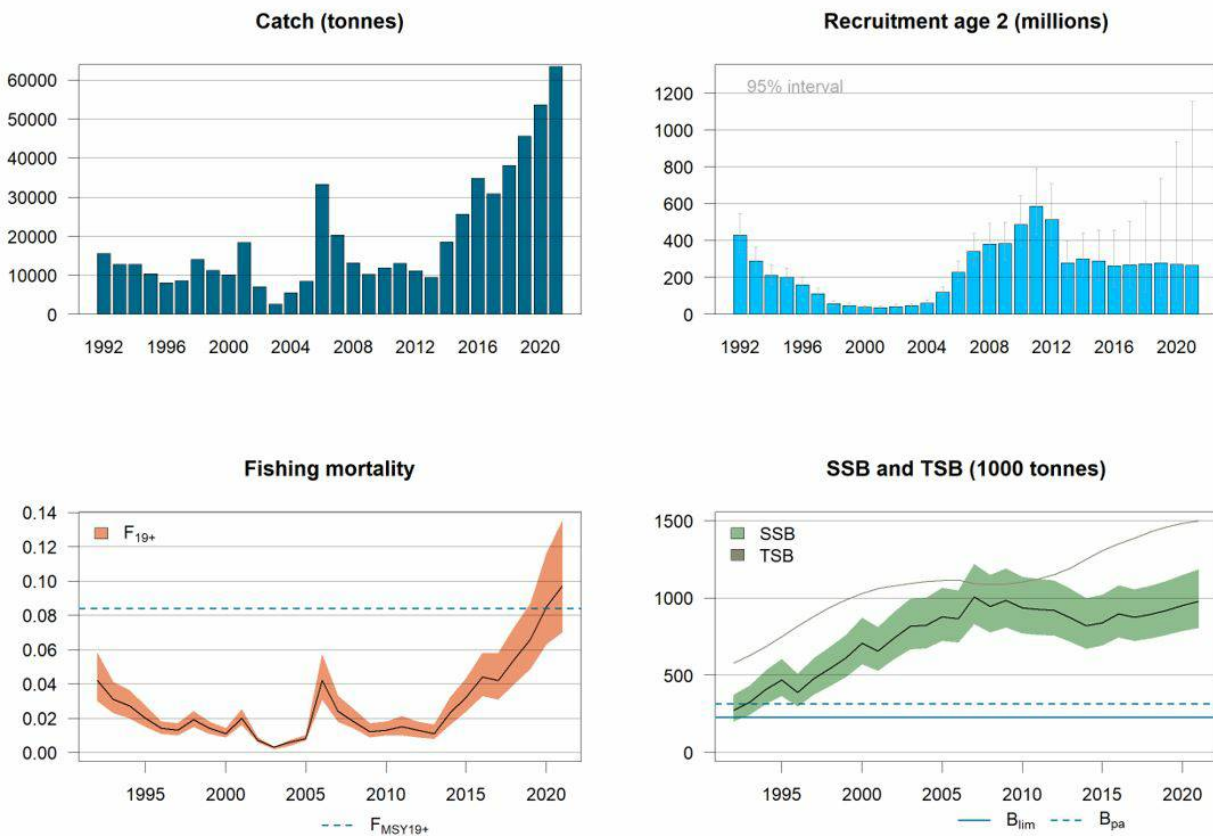

Figure 1 Beaked redfish in ICES subareas 1 and 2 (Northeast Arctic). Catch, recruitment,  $F$ , SSB and TSB (total stock biomass, age 2+) with 95 % confidence levels. The biomass reference points relate to SSB.

## Catch scenarios

Table 1 Beaked redfish in ICES subareas 1 and 2 (Northeast Arctic). Assumptions made for the interim year and in the forecast. SSB, catch in tonnes, and recruitment in thousands.

Variable	Value	Notes
$F_{\text{ages19+}}$ (2022)	0.097	$F_{\text{sq}} = F_{2021}$ . From assessment
SSB (2023)	1 018 117	Short-term forecast
$R_{\text{age 2}}$ (2022)	307 756	Regression surveys vs. recruitment
$R_{\text{age 2}}$ (2023)	328 242	10-years average
$R_{\text{age 2}}$ (2024)	328 242	10-years average
Total catch (2022)	64 159	Short-term forecast

Table 2a Beaked redfish in ICES subareas 1 and 2 (Northeast Arctic). Annual catch scenarios for 2023. All weights are in tonnes.

Basis	Total catch (2023)	$F_{\text{total}}$ (2023)	SSB (2024)	% SSB change *	% TAC change **	% Advice change ***
Advice basis						
$F_{2023} = F_{2022}$	66 779	0.097	1 040 323	6.5	-0.6	-0.6

Suggested 50 000 t cap for all evaluated HCRs	50 000	0.072	1 055 819	8.1	-25.6	-25.6
* SSB 2024 relative to SSB 2021 (976 956 tonnes).						
** Catch in 2023 relative to TAC set by Norway and Russia for 2022 (67 210 tonnes).						
*** Advice value for 2023 relative to the advice value for 2022.						

Table 2b Beaked redfish in ICES subareas 1 and 2 (Northeast Arctic). Annual catch scenarios for 2024. All weights are in tonnes.

Basis	Total catch (2024)	F <sub>total</sub> (2024)	SSB (2025)	% SSB change *	% TAC change **	% Advice change ***
Advice basis						
F <sub>2024</sub> = F <sub>2023</sub>	70 164	0.097	1 055 435	8.0	5.1	5.1
Other scenarios						
F = 0.06	45 191	0.060	1 101 812	12.8	-32.3	-32.3
F = 0.08	58 950	0.080	1 076 409	10.2	-11.7	-11.7
F = 0.084	61 627	0.084	1 071 423	9.7	-7.7	-7.7
F = 0.10	72 098	0.100	1 051 791	7.7	8.0	8.0
Suggested 50 000 t cap for all evaluated HCRs	50 000	0.072	1 092 973	11.9	-25.1	-25.1

\* SSB 2025 relative to SSB 2021 (976 956 tonnes).

\*\* Catch in 2024 relative to TAC in 2023 under the status quo scenario (66 779 tonnes).

\*\*\* Advice value for 2024 relative to the advice value for 2023.

The advice for 2023 is 0.9% higher than the advice for 2021 due to increasing stock size and status quo advice but 0.6% lower than the advice for 2022.

## Basis of the advice

Table 3 Beaked redfish in ICES subareas 1 and 2 (Northeast Arctic). The basis of the advice.

Advice basis	Status quo
Management plan	There is no agreed management plan for this stock. Long-term management plan options have been evaluated by ICES (ICES, 2018a).

## Quality of the assessment

The stock was benchmarked in 2018. The choice of a scaling coefficient for the Norwegian–Russian ecosystem survey is a source of potential bias of up to 50%, but the advice is robust to this uncertainty.

Data from the pelagic survey in the Norwegian Sea was reviewed in the recent benchmark assessment and the survey is now included in the assessment model. However, the survey series still does not appropriately cover the geographical distribution of the adult population, and further inclusion of the slope survey should be prioritized.

Age determination is lacking for some surveys and catches in recent years. To account for the lack of catch-at-age data in some years a procedure using length distribution and a time-averaged age-length key was applied.

To smooth out spurious variations in SSB, caused by limited sample size in the weight-at-age of the 19+ group,

a fixed weight-at-age function (i.e. common across years) was adopted for the assessment model during the Arctic Fisheries Working Group (AFWG) meeting in 2018 (ICES 2018b).

Figure 2: Beaked redfish in ICES subareas 1 and 2 (Northeast Arctic). Historical assessment results. There was a benchmark revision in 2018.

## Issues relevant for the advice

Due to the suspension of Russian scientists from ICES, the assessment was conducted by a Joint Russian-Norwegian working group on Arctic Fisheries (JRN-AFWG) consisting of scientists from VNIRO (Russia) and IMR (Norway) (Howell et al., 2022).

This advice has been conducted outside ICES and should not be considered as ICES advice. However, the assessment has been conducted following the previous procedures and based on the methodology agreed at the ICES benchmark in 2018 (ICES, 2018c).

There has been a significant change in the selectivity, with the fraction of the catch in the 19+ age class increasing in recent years (since 2017) and especially since the last assessment. Any evaluation of a  $F_{MSY}$  or  $F_{pa}$  value is conditional on the  $F_{bar}$  and selectivities used in the evaluation. As a result of the changing selectivity, applying the same target  $F_{bar}$  will result in a reduction of the catch as a fraction of the fishable stock. Given that the catch is close to advice, and the SSB is relatively stable, we therefore propose  $F_{19+}$  status quo as an approximation to maintain the same overall fraction of the stock being caught. We note that this stock is due for a benchmark in 2024 prior to the next release of advice, and the advice basis should be revised at that time.

## Fishing mortality

Figure 3 Beaked redfish in ICES subareas 1 and 2 (Northeast Arctic). Fishing mortalities for ages 12-18 and the 19+-group with 95 % confidence levels.

Long-term management plan options have been proposed by Norway and Russia and evaluated by ICES (ICES, 2018a). In the absence of an agreed management plan, the advice is based on the MSY approach. The advice has been based on  $F_{19+} = 0.06$ . This is the highest fishing mortality of those tested during the MSE evaluations (ICES, 2018a) that was found to be precautionary. The present advice is above  $F_{19+} = 0.06$ , due to the selectivity issues mentioned above and has led to a rise in biomass.

There is no international agreement on the sharing of TAC among countries and between national and international waters.

Bycatch of the endangered golden redfish (*Sebastes norvegicus*) should be kept at a minimum to allow for rebuilding of that stock.

## Reference points

Table 4 Beaked redfish in ICES subareas 1 and 2 (Northeast Arctic). Reference points, values, and their technical basis.

Framework	Reference point	Value	Technical basis	Source
MSY approach	MSY $B_{\text{trigger}}$	315 000 t	$B_{\text{pa}}$	ICES (2018a)
	$F_{\text{MSY}}$	0.084	$F_{0.1}$	ICES (2018a)
Precautionary approach	$B_{\text{lim}}$	227 000 t	$\sim B_{\text{loss}}$ (SSB in 1992)	ICES (2018a)
	$B_{\text{pa}}$	315 000 t	$\sim B_{\text{lim}} \times e^{(1.645 \times 0.2)}$	ICES (2018a)
	$F_{\text{lim}}$			
	$F_{\text{pa}}$			
Management plan	$SSB_{\text{mgt}}$			
	$F_{\text{mgt}}$			

## Basis of the assessment

Table 5 Beaked redfish in ICES subareas 1 and 2 (Northeast Arctic). Basis of the assessment and advice.

ICES stock data category	1 ( <a href="#">ICES, 2016</a> )
Assessment type	Statistical catch-at-age model
Input data	Commercial catches: international landings (tonnes), age frequencies and weight-at-age from catch sampling of the pelagic and demersal fisheries and from the survey; survey indices: numbers-at-age from BS-NoRu-Q1-Btr, Eco-NoRu-Q3-Btr, Ru-Q4-Btr; proportion-at-age from deep pelagic ecosystem survey annual maturity data from BS-NoRu-Q1-Btr, Eco-NoRu-Q3-Btr, and commercial catch sampling; natural mortalities were fixed at 0.05.
Discards and bycatch	Discarding and bycatch are assumed negligible.
Other information	Last benchmark was in January 2018 (WKREDFISH; ICES, 2018c). Proposed management plans were evaluated in 2018 (WKREBMSSE; ICES, 2018a).
Working group	Joint Russian-Norwegian working group on Arctic Fisheries (JRN-AFWG)

## History of the advice, catch, and management

Table 6 Beaked redfish in ICES subareas 1 and 2 (Northeast Arctic). ICES advice, agreed TACs, the official and unreported landings, and ICES catches. All weights are in tonnes.
